

# Internet usage and migration decisions

## Evidence from Nigerian micro data

Maurizio Strazzeri

Department of Economics  
University of Bern

#ICDE2021  
July 1, 2021

## Motivation

- ▶ Interest in the determinants of recent south-north migration flows among policy maker
  - ▶ rising income levels (CLEMENS, 2014)
  - ▶ climate change disproportionately affecting LI countries (BEINE AND PARSON, 2015)
  - ▶ demographic imbalances (young vs old population), ...
- ▶ Often not considered: Advances in modern ICT—e.g., the Internet—facilitate information diffusion and might affect migration choices (ORTEGA AND PERI, 2015)
  - ▶ Individuals compare expected benefits and costs of migrating (SJAASTAD, 1962)
  - ▶ Internet might reduce costs of migrating (search or psychological costs) or change preferences (i.e., valuation of expected benefits)
- ▶ Empirical investigation challenging as Internet use and migration are simultaneously affected by various SE variables (e.g., age, education)

## This paper

### Objective

- ▶ Empirical investigation of the effect of Internet use on migration choices

### Approach

- ▶ Time and cross-sectional variation in Internet use caused by arrival of submarine Internet cables in Nigeria (Fuzzy DiD) (HJORT AND POULSEN 2019)
- ▶ Geo-coded Nigerian GHS panel

### Findings

- ▶ Individuals located close to the cable network respond with larger increase in Internet use and migration rates
- ▶ Effect driven by migration out of Africa and larger for individuals from the lower part of the wealth distribution
- ▶ Positive effect on subsequent remittances and human capital investments of remaining households

### International migration in Nigeria

- ▶ Most populous country in Africa; experienced massive population growth
  - ▶ Population of 45 mio in 1960s; more than 200 mio today
- ▶ Young population and high fertility rates suggest further population growth
  - ▶ UN DESA: Population will surpass population of the US in 2050
- ▶ Important role in African migration due to size and demographic peculiarities
- ▶ “Reversed migration transition” (De Haas 2007) from an immigration to a net emigration country
  - ▶ *Diverse* and often permanent cross-boarder migration
  - ▶ High-skilled migration mainly to Anglo-Saxon countries
  - ▶ Low-skilled migration to Western Europe, Gulf states, and other African countries
  - ▶ High willingness to migrate, e.g., 25 % considered moving abroad, 12 % are planning to move within 2 years or are currently making preparations (Afrobarometer 2017)

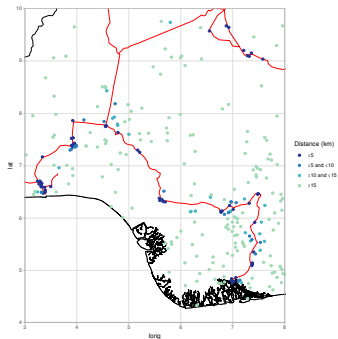

### Internet use in Western Africa and Nigeria

- ▶ Large increase in Internet use in Sub-Saharan Africa in the past two decades
  - ▶ Basically non-existent in 2000 (EU: 20 %), 7 % (68 %) in 2010, 25 % (82 %) in 2017
  - ▶ Much of the growth driven by Internet use in Nigeria
- ▶ Internet use in Sub-Saharan Africa depends on submarine Internet cables
  - ▶ Starting in 2010, 4 submarine cables connected from Europe to land-based stations in Western Africa
  - ▶ Brought faster, cheaper, and more reliable Internet to locations that are connected to the *terrestrial cable network* (drop in bandwidth prices by ca. 50 %)
  - ▶ Connection to terrestrial cable network (last mile technology): wireline (e.g., copper cables) or wireless (cell towers, satellites)

## Data

- ▶ Nigerian geo-coded survey panel data (2010, 2012, 2016) linked to historical maps of terrestrial cable network (FIGURE)
  - ▶ Geo-coded data allows me to calculate distance between community and terrestrial cable network
- ▶ Questionnaire on ICT use
  - ▶ “Do you have access to the Internet?” (binary)
  - ▶ “How often do you use the Internet?” (ordinal)
- ▶ Measure of migration
  - ▶ Remaining HH members are asked about the whereabouts of individuals
  - ▶ Information about migration linked to prior Internet use (FIGURE)
- ▶ Final data: 21,626 obs, 435 communities, 1 before/after observation

## Increase in Internet use and distance to terrestrial cable network

*Note:* Plot on the right shows coefficient estimates for a regression of Internet usage on interactions of a set of binary variables indicating if individual  $i$  is located within a bin shown on the x-axis and an indicator variable for the year 2012 (baseline: Distance to terrestrial cable network larger than 15 km). All estimates include a year dummy for the year 2012 as well as community fixed effects. Number of observations: 21,626. 95% confidence intervals are based on cluster-robust standard errors at the community level (435 cluster). (FIGURES)

### Approach:

- ▶ Internet usage and migration simultaneously affected by SE variables suggests that naive OLS estimates are severely biased (TABLE)
- ▶ Exploit differential change in Internet use over time of “connected” and “unconnected” locations as exogenous source of variation in Internet use
- ▶ *Fuzzy* difference-in-difference design estimated by 2SLS:

(DE CHAISEMARTIN AND D’HAULTFOEUILLE, 2018)

$$Int_{i,c(i),t} = \mu_{c(i)}^F + \beta_0^F \mathbb{1}[t = 12] + \beta_1^F \mathbb{1}[t = 12] * Dist_{c(i)} + e_{i,c(i),t}$$

$$Mig_{i,c(i),t+k(t)} = \mu_{c(i)}^S + \beta_0^S \mathbb{1}[t = 12] + \beta_1^S \hat{Int}_{i,c(i),t} + \epsilon_{i,c(i),t}$$

### Identifying assumption:

- ▶ Migration rates would have evolved similarly if the share of Internet users had not expanded differently across locations

→  $\beta_1^S$  estimates the effect of *Int* on *Mig* for compliers/switchers in connected areas

## Illustration of first-stage and reduced form relationship

(a) Change in Internet use

(b) Change in migration rate

*Note:* Binned scatter plot (10 equally sized bins) of difference in community mean Internet usage (left) and migration (right) between 2012 and 2010 and distance to terrestrial cable network in kilometers. 435 communities included. (FIGURES)

## Main findings, robustness, and further results

### Main results

- ▶ Individuals located close to the cable network respond with larger increase in Internet use and migration rates
  - ▶ 2SLS estimate: Internet use increases migration by 10pp (TABLE) (TABLE REDUCED)

### Robustness

- ▶ Exclude observations close to (TABLE) or remote from connected areas (TABLE)
- ▶ Add placebo treatment variables (TABLE)
- ▶ Exclude locations in connected area with employment growth (TABLE)
- ▶ Test for differential trends in observable variables (TABLE)
- ▶ Check pre-treatment trend for outcome variable (TABLE)

### Further results

- ▶ Effect driven by for migration out of Africa (TABLE) and larger for individuals from the lower part of the wealth distribution (TABLE)
- ▶ Positive effect on subsequent remittances and human capital investments of remaining households (TABLE)

## Appendix

# Internet usage and migration decisions

## Mean values of selected variables by Internet usage

	No Internet usage	Internet usage
<i>Socio-economic</i>		
Age	32.56	29.13
Female	0.53	0.35
Household member		
Head	0.26	0.23
Spouse	0.34	0.09
Son/Daughter	0.35	0.61
Other	0.05	0.08
Currently enrolled	0.22	0.45
Highest education		
No schooling	0.37	0.02
Some schooling	0.25	0.04
Secondary education	0.35	0.66
University degree	0.02	0.28
Number of wealth items		
0	0.25	0.02

Controls	No	Yes	Yes	Yes	Yes
State FE	No	No	Yes	No	No
County FE	No	No	No	Yes	No
Community FE	No	No	No	No	Yes
Observations	21,626	21,626	21,626	21,626	21,626
Cluster	435	435	435	435	435

*Note:* Regression of a binary variable indicating whether an individual moved to another country on Internet usage and Internet usage frequency in the previous wave. Internet usage frequency is a ordinal measure (0 = less than a month / no access, 1 = at least once a month, 2 = at least once a week, 3 = daily). Control variables included are: Age, sex (binary), household member (binary: head, spouse, son/daughter, other), enrolled in school (binary), highest education (binary: no schooling, some schooling, secondary education, university degree), number of wealth items (binary: 0 to 4), other ICT usage (binary: mobile phone, TV). Robust standard errors clustered at the community level in parentheses. Significance levels: \*  $p < 0.1$ , \*\*  $p < 0.05$ , \*\*\*  $p < 0.01$ .

Cluster	435	435	435	435	435
Included covariates (Panel A and B):					
Year 12 FE	Yes	Yes	Yes	Yes	Yes
Community FE	Yes	Yes	Yes	Yes	Yes
Controls	Yes	Yes	Yes	Yes	Yes

*Note:* Dependent variable is a binary variable indicating if an individual migrated to another country. Control variables included are: Age, sex (binary), household member (binary: head, spouse, son/daughter, other), enrolled in school (binary), highest education (binary: no schooling, some schooling, secondary education, university degree), number of wealth items (binary: 0 to 4), other ICT usage (binary: mobile phone, TV). *Lagos or Abuja* is a binary variable indicating whether an individual is located either in Lagos or Abuja, *Urban* is a binary variable indicating whether an individual resides in an urban area. *Internet usage year 10* is a binary variable indicating whether an individual lives in a community where the share of Internet users in 2010 was in the highest quartile in the sample. *Education year 10* is a binary variable indicating whether an individual lives in a community where the share of college educated individuals in 2010 was in the highest quartile in the sample. Robust standard errors clustered at the community level in parentheses.

Significance levels: \*  $p < 0.1$ , \*\*  $p < 0.05$ , \*\*\*  $p < 0.01$ .

## Chapter I: Robustness: Parallel pre-trends, remittances

Note: Plot shows estimated coefficients  $\beta_{1,10}$  and  $\beta_{1,15}$  of the equation:

$$Remittances_{h,c(h),t} = \mu_c + \sum_{j \in \{10,15\}} \{ \beta_{0,j} 1[t=j] + \beta_{1,j} 1[t=j] * 1[Distance_{h,c(h)} < 5km] \} + \epsilon_{h,c(h),t},$$

where  $Remittances_{h,c(h),t}$  is a binary variable indicating whether household  $h$  located in community  $c(h)$  has received remittances within 12 month before the interview year  $t$ , and  $\mu_c$  represents a set of community fixed effects. 2010 (2012, 2015) refers to the first (second, third) wave of the Nigerian GHS panel. Estimates are based on a sample at household level. Number of observations: 10,414. Plotted 95% confidence intervals are based on cluster-robust standard errors at the community level (435 cluster).

# Internet usage and migration decisions

## Instrumental variable estimation: Internet usage on migration

	(1)	(2)	(3)	(4)
<i>First-stage estimates</i>				
<i>Internet usage</i>				
Log(Distance to network) * Year 12	-0.014** (0.006)	-0.014** (0.006)	-0.023*** (0.006)	-0.021*** (0.005)
F statistic	6.06	6.28	16.19	14.06
<i>Internet usage frequency</i>				
Log(Distance to network) * Year 12	-0.029*** (0.009)	-0.029*** (0.009)	-0.047*** (0.010)	-0.044*** (0.010)
F statistic	9.72	10.26	21.58	18.89
<i>Second-stage estimates</i>				
Internet usage	0.096* (0.056)	0.098* (0.056)	0.105** (0.048)	0.116** (0.054)
Internet usage frequency	0.047* (0.024)	0.048** (0.024)	0.050** (0.022)	0.055** (0.024)
Year FE	Yes	Yes	Yes	Yes
Community FE	Yes	Yes	Yes	Yes
Controls	No	Yes	No	Yes
Restricted: Age 20 to 35	No	No	Yes	Yes
Observations	21,626	21,626	8,963	8,963
Cluster	435	435	435	435

Note: Instrumental variable estimates of the effect of Internet usage and Internet usage frequency on migration decisions. Excluded instrument: Log distance to the terrestrial cable network times an indicator variable for the year 2012. Dependent variable of the first-stage estimates in the first (second) row is Internet usage (Internet usage frequency). Internet usage is a binary variable indicating whether an individual reported in the survey interview that he or she has access to the Internet. Internet usage frequency is an ordinal measure of frequency (0 = less than a month / no access, 1 = at least once a month, 2 = at least once a week, 3 = daily). Dependent variable of the second-stage estimates in the third and fourth rows is a binary variable indicating if an individual migrated to another country. Control variables included are: Age, sex (binary), household member (binary: head, spouse, son/daughter, other), enrolled in school (binary), highest education (binary: no schooling, some schooling, secondary education, university degree), number of wealth items (binary: 0 to 4), other ICT usage (binary: mobile phone, TV). Robust standard errors clustered at the community level in parentheses. [go back](#)

Significance levels: \* p < 0.1, \*\* p < 0.05, \*\*\* p < 0.01.

Reported coefficient:				
Log(Distance to network) * Year 12	Yes	Yes	No	No
$\mathbb{1}(\text{Distance to network} < 5\text{km}) * \text{Year 12}$	No	No	Yes	Yes
Year 12 FE	Yes	Yes	Yes	Yes
Community FE	Yes	Yes	Yes	Yes
Controls	Yes	Yes	Yes	Yes
Restricted: Age 20 to 35	No	Yes	No	Yes
Observations	21,626	8,963	21,626	8,963
Cluster	435	435	435	435

Note: First column specifies the dependent variable of a regression on measures of distance to the terrestrial cable network times an indicator variable for the year 2012. Robust standard errors clustered at the community level in parentheses.

Significance levels: \*  $p < 0.1$ , \*\*  $p < 0.05$ , \*\*\*  $p < 0.01$ .

## Internet usage and migration decisions

### Instrumental variable estimation: Migration out of Africa

	(1)	(2)	(3)	(4)	(5)	(6)
Internet usage	0.116** (0.054)	0.070* (0.039)	0.016 (0.013)			
Internet usage frequency				0.055** (0.024)	0.033* (0.017)	0.008 (0.006)
Year 12 FE	Yes	Yes	Yes	Yes	Yes	Yes
Community FE	Yes	Yes	Yes	Yes	Yes	Yes
Controls	Yes	Yes	Yes	Yes	Yes	Yes
Restricted: Age 20 to 35	Yes	Yes	Yes	Yes	Yes	Yes
Dependent variable:						
All migration	Yes	No	No	Yes	No	No
Migration out of Africa	No	Yes	No	No	Yes	No
Migration within in Africa	No	No	Yes	No	No	Yes
Observations	8,963	8,957	8,957	8,963	8,957	8,957
Cluster	435	435	435	435	435	435

*Note:* Instrumental variable estimates of the effect of Internet usage and Internet usage frequency on migration decisions. Excluded instrument: Log distance to the terrestrial cable network times an indicator variable for the year 2012. Dependent variable is a binary variable indicating if an individual migrated to (1) another country, (2) out of Africa, and (3) within Africa (migration out of Africa is coded 0 in this case). Internet usage is a binary variable indicating whether an individual reported in the survey interview that he or she has access to the Internet. Internet usage frequency is an ordinal measure of frequency (0 = less than a month / no access, 1 = at least once a month, 2 = at least once a week, 3 = daily). Robust standard errors clustered at the community level in parentheses.

Significance levels: \*  $p < 0.1$ , \*\*  $p < 0.05$ , \*\*\*  $p < 0.01$ .

## Internet usage and migration decisions

### Instrumental variable estimation: Migration out of Africa, full sample

	(1)	(2)	(3)	(4)	(5)	(6)
Internet usage	0.098* (0.056)	0.049 (0.032)	0.016 (0.013)			
Internet usage frequency				0.048** (0.024)	0.024* (0.014)	0.008 (0.006)
Year 12 FE	Yes	Yes	Yes	Yes	Yes	Yes
Community FE	Yes	Yes	Yes	Yes	Yes	Yes
Controls	Yes	Yes	Yes	Yes	Yes	Yes
Dependent variable:						
All migration	Yes	No	No	Yes	No	No
Migration out of Africa	No	Yes	No	No	Yes	No
Migration within in Africa	No	No	Yes	No	No	Yes
Observations	21,626	21,612	21,612	21,626	21,612	21,612
Cluster	435	435	435	435	435	435

*Note:* Instrumental variable estimates of the effect of Internet usage and Internet usage frequency on migration decisions. Excluded instrument: Log distance to the terrestrial cable network times an indicator variable for the year 2012. Dependent variable is a binary variable indicating if an individual migrated to (1) another country, (2) out of Africa, and (3) within Africa (migration out of Africa is coded 0 in this case). Internet usage is a binary variable indicating whether an individual reported in the survey interview that he or she has access to the Internet. Internet usage frequency is an ordinal measure of frequency (0 = less than a month / no access, 1 = at least once a month, 2 = at least once a week, 3 = daily). Robust standard errors clustered at the community level in parentheses.

Significance levels: \*  $p < 0.1$ , \*\*  $p < 0.05$ , \*\*\*  $p < 0.01$ .

# Internet usage and migration decisions

## Instrumental variable estimation: Relative wealth, 2 endogenous variables

	(1)	(2)	(3)	(4)	(5)	(6)
<i>First-stage estimate</i>						
Log(Dist. to network) * Year 12	-0.021*** (0.007)	0.001 (0.002)	-0.045*** (0.014)	0.003 (0.004)		
Log(Dist. to network) * Year 12 * Low wealth	0.003 (0.010)	-0.019*** (0.006)	0.005 (0.021)	-0.044*** (0.014)		
<i>Second-stage estimates</i>						
Internet usage * Low wealth					0.149 (0.104)	
Internet usage					0.068 (0.050)	
Internet usage frequency * Low wealth						0.064 (0.045)
Internet usage frequency						0.032 (0.022)
F-statistic (First stage)					10.80	11.04
Endogenous variable:						
Internet usage	Yes	Yes	No	No	Yes	No
Internet usage frequency	No	No	Yes	Yes	No	Yes
Year 12 FE	Yes	Yes	Yes	Yes	Yes	Yes
Community FE	Yes	Yes	Yes	Yes	Yes	Yes
Controls	Yes	Yes	Yes	Yes	Yes	Yes
Restricted: Age 20 to 35	Yes	Yes	Yes	Yes	Yes	Yes
Observations	8,963	8,963	8,963	8,963	8,963	8,963
Cluster	435	435	435	435	435	435

*Note:* Instrumental variable estimates of the effect of Internet usage and Internet usage times a binary variable indicating low wealth and Internet usage frequency and Internet usage frequency times a binary variable indicating low wealth on migration decisions. Excluded instruments: Log distance to the terrestrial cable network times an indicator variable for the year 2012 and an interaction with a binary variable indicating low wealth. Internet usage is a binary variable indicating whether an individual reported in the survey interview that he or she has access to the Internet. Internet usage frequency is an ordinal measure of frequency (0 = less than a month / no access, 1 = at least once a month, 2 = at least once a week, 3 = daily). Dependent variable of the second-stage estimates in the third and fourth rows is a binary variable indicating if an individual migrated to another country. Individuals are defined as having *low wealth* if the number of wealth items of their household is below the mean of the number of wealth items in the respective community in which they are living. Individuals with *high wealth* are all other individuals. Robust standard errors clustered at the community level in parentheses. [go back](#)

Significance levels: \*  $p < 0.1$ , \*\*  $p < 0.05$ , \*\*\*  $p < 0.01$ .

## Internet usage and migration decisions

### Feedback effects: Migration and economic development

	(1)	(2)	(3)	(4)
$\mathbb{1}(\text{Distance to network} < 5\text{km}) * \text{Year 15}$	0.029** (0.014)	-0.077 (0.056)	0.022 (0.021)	0.093* (0.055)
$\mathbb{1}(\text{Distance to network} < 5\text{km}) * \text{Year 10}$	0.003 (0.005)	0.027 (0.046)	0.009 (0.024)	-0.028 (0.063)
Year FE	Yes	Yes	Yes	Yes
Community FE	Yes	Yes	Yes	Yes
Dependent variable:				
Remittances	Yes	No	No	No
Wealth items	No	Yes	No	No
Share HH member enrolled (age 10 to 18)	No	No	Yes	No
Share HH member enrolled (age 15 to 18)	No	No	No	Yes
Observations	10,414	10,414	8,031	3,196
Cluster	436	436	435	432

*Note:* Estimate of various outcome variables on interactions between a binary variable indicating whether a household is located within a 5 km radius around the terrestrial cable network and year dummies for the year 2010 and 2015. Number of observations is smaller in the third and fourth column as not all households have children in the depicted age bracket. Robust standard errors clustered at the community level in parentheses. Significance levels: \*  $p < 0.1$ , \*\*  $p < 0.05$ , \*\*\*  $p < 0.01$ .
